**FROM UNDERSTANDING COMPUTATION TO
UNDERSTANDING NEURAL CIRCUITRY**

by

D. Marr and T. Poggio*

Abstract: The CNS needs to be understood at four nearly independent levels of description: (1) that at which the nature of a computation is expressed; (2) that at which the algorithms that implement a computation are characterized; (3) that at which an algorithm is committed to particular mechanisms; and (4) that at which the mechanisms are realized in hardware. In general, the nature of a computation is determined by the problem to be solved, the mechanisms that are used depend upon the available hardware, and the particular algorithms chosen depend on the problem and on the available mechanisms. Examples are given of theories at each level.

On the Design and Development of Program Families

DAVID L. PARNAS

One may consider a program development to be good, if the early decisions exclude only uninteresting, undesired, or unnecessary programs. The decisions which remove desired programs would be either postponed until a later stage or confined to a well delimited subset of the code. Objective criticism of a program's structure would be based upon the fact that a decision or assumption which was likely to change has influenced too much of the code either because it was made too early in the development or because it was not confined to an information hiding module.

Clearly this is not the only criterion which one may use in evaluating program structures. Clarity (e.g., ease of understanding, ease of verification) is another quite relevant consideration. Although there is some reason to suspect that the two measures are not completely unrelated, there are no rea-

Functional modularity

A module is a part of a **description** of a system

- ▶ Modularity should be invariant under physically entangled emulation with dye pack
- ▶ Modularity makes a theory more concise, comprehensible
- ▶ 'Functional structure' (Gallistel)/
'Wirkungsgefüge' (behavioral physiology)/source code

general description $\xrightarrow{\text{specialize}}$ specific machinery

Functional modularity

A module is a part of a **description of a system**

- ▶ Modularity should be invariant under physically entangled emulation with dye pack
- ▶ Modularity makes a theory more concise, comprehensible
- ▶ 'Functional structure' (Gallistel)/
'Wirkungsgefüge' (behavioral physiology)/source code

Good decomposition helps **reuse when environment changes**

- ▶ Utterances need not re-conventionalize
- ▶ Organisms need not re-learn
- ▶ Species need not re-evolve
- ▶ Researchers need not re-discover

Lambda the ultimate

The essence of reuse:
a module is a sub-expression.
Binding. Higher-order abstractions.

Types classify terms. Polymorphism
circumscribes information flow.

1. Expressions and interpretations
in Abstract Categorical Grammar
2. Layers of monads for
quantification and state

Lambda the ultimate

Abstract Categorical Grammar

$e = \lambda\langle \text{john}, \text{mary}, \text{like}, r_1, r_2 \rangle.$
 $r_1 \text{ john } (r_2 \text{ like mary})$

Abstract Categorical Grammar

$$e = \lambda \langle \text{john}, \text{mary}, \text{like}, r_1, r_2 \rangle.$$
$$r_1 \text{ john } (r_2 \text{ like mary})$$

$$\text{EN} = \langle \text{'John'},$$
$$\text{'Mary'},$$
$$\text{'likes'},$$
$$\lambda s. \lambda v. s \hat{\ } ' \hat{\ } v,$$
$$\lambda v. \lambda o. v \hat{\ } ' \hat{\ } o \rangle$$

$$\text{Sem} = \langle j',$$
$$m',$$
$$l',$$
$$\lambda s. \lambda v. vs,$$
$$\lambda v. \lambda o. vo \rangle$$

$$e(\text{EN}) = \text{'John likes Mary'}$$

$$e(\text{Sem}) = l m j$$

Abstract Categorical Grammar

$$e = \lambda \langle \text{john}, \text{mary}, \text{like}, r_1, r_2 \rangle. \\ r_1 \text{ john } (r_2 \text{ like mary})$$

$$\text{JA} = \langle \dots \rangle$$

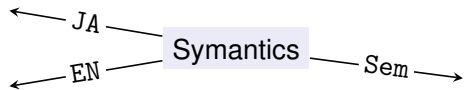

$$\text{EN} = \langle \text{'John'}, \\ \text{'Mary'}, \\ \text{'likes'}, \\ \lambda s. \lambda v. s \hat{\wedge} \text{' } \hat{\wedge} v, \\ \lambda v. \lambda o. v \hat{\wedge} \text{' } \hat{\wedge} o \rangle$$

$$\text{Sem} = \langle j', \\ m', \\ l', \\ \lambda s. \lambda v. vs, \\ \lambda v. \lambda o. vo \rangle$$

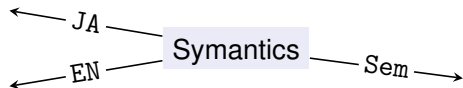

$$e(\text{JA}) = \text{'ジョンさんはメリさんのことが好きだ'}$$

$$e(\text{EN}) = \text{'John likes Mary'} \quad e(\text{Sem}) = l m j$$

Interpretations

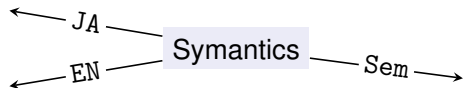

Interpretation transformers

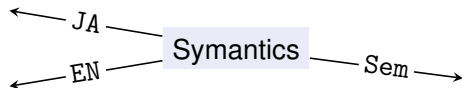

$$\text{Sem} = \langle j', \\ m', \\ l', \\ \lambda s. \lambda v. vs, \\ \lambda v. \lambda o. vo \rangle$$

Interpretation transformers

$$\text{Sem} = \lambda \langle j, m, l, @, \neg, \wedge, \dots \rangle.$$
$$\langle j,$$
$$m,$$
$$l,$$
$$\lambda s. \lambda v. @vs,$$
$$\lambda v. \lambda o. @vo \rangle$$

Interpretation transformers

Sem = $\lambda\langle j, m, l, @, \neg, \wedge, \dots \rangle.$

$\langle j,$

$m,$

$l,$

$\lambda s. \lambda v. @vs,$

$\lambda v. \lambda o. @vo \rangle$

R = $\langle j', m', l', \lambda f. \lambda x. fx, \dots \rangle$

C = $\langle 'j', 'm', 'l', \lambda f. \lambda x. f^{\wedge}('x^{\wedge}'), \dots \rangle$

P = $\lambda\langle j, m, l, @, \neg, \wedge, \dots \rangle. \langle \dots \rangle$

Interpretation transformers

Sem = $\lambda\langle j, m, l, @, \neg, \wedge, \dots \rangle.$

$\langle j,$
 $m,$
 $l,$
 $\lambda s. \lambda v. @vs,$
 $\lambda v. \lambda o. @vo \rangle$

R = $\langle j', m', l', \lambda f. \lambda x. fx, \dots \rangle$

C = $\langle 'j', 'm', 'l', \lambda f. \lambda x. f^{\wedge}('x^{\wedge}'), \dots \rangle$

P = $\lambda\langle j, m, l, @, \neg, \wedge, \dots \rangle. \langle \dots \rangle$

Interpretation transformers

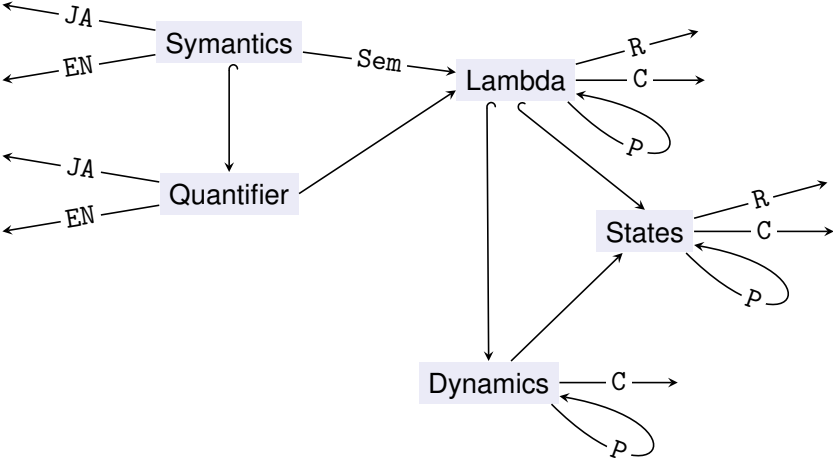

$\lambda\langle \text{john, mary, like, } r_1, r_2, \text{ every, some, } r_4, r_5 \rangle.$
 $\langle \text{john, mary, like, } r_1, r_2 \rangle$

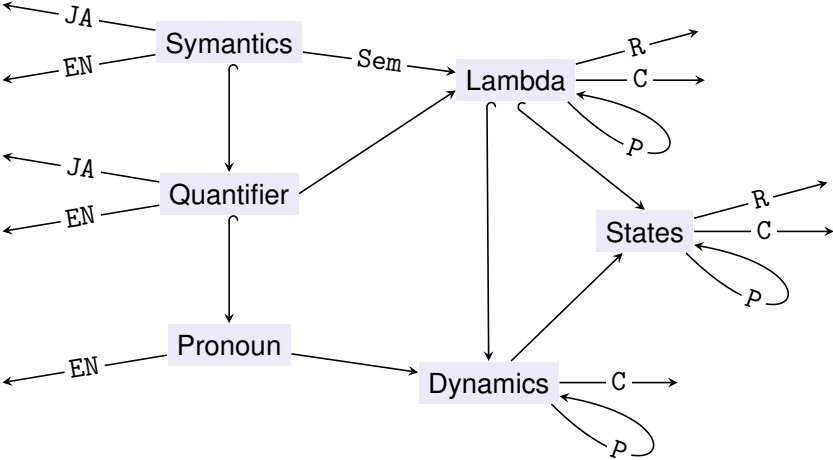

Dynamic logic

Dynamic logic

Dynamic logic

Expression transformers

Macros are maps from expressions to expressions.

$$\vee = \lambda\langle j, m, l, @, \neg, \wedge, \dots \rangle. \\ \lambda e_1. \lambda e_2. \neg(\wedge(\neg e_1)(\neg e_2))$$

Also for analyzing unquotation.
